SUBJECT: Indoor Air Quality (IAQ) Assessment FISH 861

On August 8, 2005 the IAQ Assessment Team conducted an assessment of FISH 861 at **McFatter Technical Center**. The evaluation consisted of a walkthrough of the identified areas to assess the current condition of the location with regard to indoor air quality. This assessment included observations of the carpet, floor tile, ceiling tile, interior walls, false ceiling plenum, and accessible ventilation equipment.

Attached are the findings of this assessment along with recommendations for further assessment, remediation, or corrective actions, if needed.

Generally, the IAQ Assessment did not identify any existing conditions significantly impacting IAQ and thereby presenting immediate health and safety concerns to building occupants. However, due to individual sensitivities and predisposing health factors, it is possible that some building occupants may elicit a health response to agents and / or conditions identified during the evaluation. Therefore, to further improve IAQ, prevent development of future IAQ-related problems, and to reduce the potential for IAQ-related complaints by building occupants, the IAQ Assessment Team recommends appropriate follow up of each item identified and listed in the attached evaluation.

Should any questions arise, or if the current concerns continue after the attached recommendations have been addressed, please feel free to contact me at 754-321-1638.

Observations

Findings:

Dust and debris on HVAC supply grills

- 5 live plants in room
- Humidity level elevated

Recommendations:

Site Based Maintenance:

Clean HVAC supply grills with Wexcide disinfectant solution

Remove all live plants from room

Continue to monitor this location for any signs of microbial growth as well as dust and debris accumulation and clean as appropriate

Physical Plant Operations Division: - Evaluate and repair HVAC system to lower humidity level
